# REGRESSION IN R

Jan-Philipp Kolb

23 Mai, 2019

## Why a part on simple regression

- ▶ Some machine learning concepts are based on regression
- We would like to remind you how simple regression works in R.
- We also want to show the constraints
- ▶ In a next step we will learn, how to coop with these constraints

## VARIABLES OF THE MTCARS DATASET

Help for the mtcars dataset:

#### ?mtcars

- mpg Miles/(US) gallon
- cyl Number of cylinders
- disp Displacement (cu.in.)
- hp Gross horsepower
- drat Rear axle ratio
- wt Weight (1000 lbs)
- ▶ qsec 1/4 mile time
- ▶ vs Engine (0 = V-shaped, 1 = straight)
- ightharpoonup am Transmission (0 = automatic, 1 = manual)
- gear Number of forward gears
- carb Number of carburetors

# DATASET MTCARS

	mpg	cyl	disp	hp	drat	wt	qsec	VS	aı
Mazda RX4	21.0	6	160.0	110	3.90	2.620	16.46	0	
Mazda RX4 Wag	21.0	6	160.0	110	3.90	2.875	17.02	0	
Datsun 710	22.8	4	108.0	93	3.85	2.320	18.61	1	
Hornet 4 Drive	21.4	6	258.0	110	3.08	3.215	19.44	1	
Hornet Sportabout	18.7	8	360.0	175	3.15	3.440	17.02	0	
Valiant	18.1	6	225.0	105	2.76	3.460	20.22	1	
Duster 360	14.3	8	360.0	245	3.21	3.570	15.84	0	
Merc 240D	24.4	4	146.7	62	3.69	3.190	20.00	1	
Merc 230	22.8	4	140.8	95	3.92	3.150	22.90	1	
Merc 280	19.2	6	167.6	123	3.92	3.440	18.30	1	
Merc 280C	17.8	6	167.6	123	3.92	3.440	18.90	1

Cadillac Fleetwood	10.4	8	472.0	205	2.93	5.250	17.98	0	
Lincoln Continental	10.4	8	460.0	215	3.00	5.424	17.82	0	

Jan-Philipp Kolb

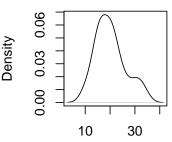

### DISTRIBUTIONS OF TWO VARIABLES OF MTCARS

```
par(mfrow=c(1,2))
plot(density(mtcars$wt)); plot(density(mtcars$mpg))
```

# density.default(x = mtcars\$ensity.default(x = mtcars\$i

N = 32 Bandwidth = 0.3455

N = 32 Bandwidth = 2.477

### A SIMPLE REGRESSION MODEL

# DEPENDENT VARIABLE - MILES PER GALLON (MPG)

# INDEPENDENT VARIABLE - WEIGHT (WT)

```
m1 <- lm(mpg ~ wt,data=mtcars)
m1

##
## Call:
## lm(formula = mpg ~ wt, data = mtcars)
##
## Coefficients:
## (Intercept) wt
## 37.285 -5.344</pre>
```

## GET THE MODEL SUMMARY

```
summary(m1)
##
## Call:
## lm(formula = mpg ~ wt, data = mtcars)
##
## Residuals:
##
      Min 1Q Median
                             3Q
                                    Max
## -4.5432 -2.3647 -0.1252 1.4096 6.8727
##
## Coefficients:
              Estimate Std. Error t value Pr(>|t|)
##
## (Intercept) 37.2851 1.8776 19.858 < 2e-16 ***
        -5.3445 0.5591 -9.559 1.29e-10 ***
## wt.
## ---
## Signif. codes: 0 '***' 0.001 '**' 0.05 '.' 0.1 ''
##
## Residual standard error: 3.046 on 30 degrees of freedom
```

## THE MODEL FORMULA

#### Model without intercept

```
m2 <- lm(mpg ~ - 1 + wt,data=mtcars)
summary(m2)$coefficients

## Estimate Std. Error t value Pr(>|t|)
## wt 5.291624 0.5931801 8.920771 4.55314e-10
```

#### Adding further variables

```
m3 <- lm(mpg ~ wt + cyl,data=mtcars)
summary(m3)$coefficients</pre>
```

```
## Estimate Std. Error t value Pr(>|t|)
## (Intercept) 39.686261 1.7149840 23.140893 3.043182e-20
## wt -3.190972 0.7569065 -4.215808 2.220200e-04
## cvl -1.507795 0.4146883 -3.635972 1.064282e-03
```

#### THE COMMAND AS. FORMULA

```
?as.formula

class(fo <- mpg ~ wt + cyl)

## [1] "formula"

# The formula object can be used in the regression:
m3 <- lm(fo,data=mtcars)</pre>
```

# FURTHER POSSIBILITIES TO SPECIFY THE FORMULA

### INTERACTION EFFECT

```
# effect of cyl and interaction effect:
m3a<-lm(mpg~wt*cyl,data=mtcars)
# only interaction effect:
m3b<-lm(mpg~wt:cyl,data=mtcars)</pre>
```

#### TAKE THE LOGARITHM

```
m3d<-lm(mpg~log(wt),data=mtcars)</pre>
```

### THE COMMAND MODEL.MATRIX

With model.matrixthe qualitative variables are automatically dummy encoded

#### ?model.matrix

#### model.matrix(m3d)

##	(Intercept)	log(wt)
## Mazda RX4	1	0.9631743
## Mazda RX4 Wag	1	1.0560527
## Datsun 710	1	0.8415672
## Hornet 4 Drive	1	1.1678274
## Hornet Sportabout	1	1.2354715
## Valiant	1	1.2412686
## Duster 360	1	1.2725656
## Merc 240D	1	1.1600209
## Merc 230	1	1.1474025
## Merc 280	1	1.2354715
## Merc 280C	1	1 2354715

JAN-I HILIFF IX

# Model Matrix (II)

- We can also create a model matrix directly from the formula and data arguments
- See Matrix::sparse.model.matrix for increased efficiency on large dimension data.

```
ff <- mpg ~ log(wt):cyl
m <- model.frame(ff, mtcars)</pre>
(mat <- model.matrix(ff, m))</pre>
##
                         (Intercept) log(wt):cyl
## Mazda RX4
                                         5.779046
                                         6.336316
## Mazda RX4 Wag
## Datsun 710
                                         3.366269
                                         7.006964
## Hornet 4 Drive
                                         9.883772
## Hornet Sportabout
## Valiant
                                         7.447612
                                        10.180525
   Duster 360
                                         4 640084
```

## Merc 240D

## A MODEL WITH INTERACTION EFFECT

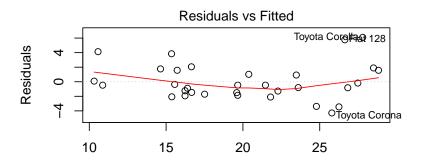

```
# disp - Displacement (cu.in.)
m3d<-lm(mpg~wt*disp,data=mtcars)
m3dsum <- summary(m3d)
m3dsum$coefficients

## Estimate Std. Error t value Pr(>|t|)
## (Intercept) 44.08199770 3.123062627 14.114990 2.955567e-14
## wt -6.49567966 1.313382622 -4.945763 3.216705e-05
## disp -0.05635816 0.013238696 -4.257078 2.101721e-04
## wt:disp 0.01170542 0.003255102 3.596022 1.226988e-03
```

## RESIDUAL PLOT - MODEL ASSUMPTIONS VIOLATED?

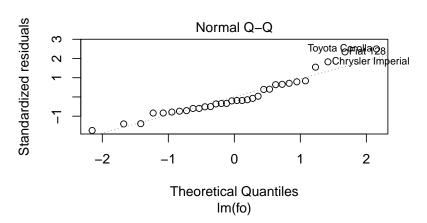

We have model assumptions violated if points deviate with a pattern from the line

plot(m3,1)

### RESIDUAL PLOT

plot(m3,2)

# EXAMPLE: OBJECT ORIENTATION

- ▶ m3 is now a special regression object
- Various functions can be applied to this object

```
predict(m3) # Prediction
resid(m3) # Residuals
```

##	Mazda RX4	Mazda RX4 Wag	Datsun 710	Horn
##	22.27914	21.46545	26.25203	
##	Hornet Sportabout	Valiant		
##	16.64696	19.59873		
##	Mazda RX4	Mazda RX4 Wag	Datsun 710	Horn
##	-1.2791447	-0.4654468	-3.4520262	
##	Hornet Sportabout	Valiant		
##	2.0530424	-1.4987281		

#### Make model prediction

```
pre <- predict(m1)
head(mtcars$mpg)

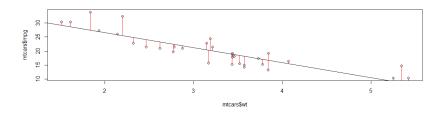

## [1] 21.0 21.0 22.8 21.4 18.7 18.1
head(pre)

## Mazda RX4 Mazda RX4 Wag</pre>
```

## Mazda RX4 Mazda RX4 Wag ## 23.28261 21.91977 ## Hornet Sportabout Valiant ## 18.90014 18.79325 Datsun 710 Horn 24.88595

### REGRESSION DIAGNOSTIC WITH BASE-R

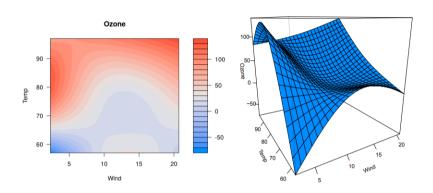

```
plot(mtcars$wt,mtcars$mpg)
abline(m1)
segments(mtcars$wt, mtcars$mpg, mtcars$wt, pre, col="red")
```

### THE VISREG-PACKAGE

install.packages("visreg")

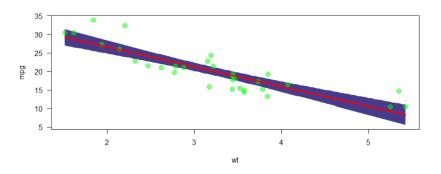

library(visreg)

#### THE VISREG-PACKAGE

- ▶ The default-argument for type is conditional.
- ▶ Scatterplot of mpg and wt plus regression line and confidence bands

```
visreg(m1, "wt", type = "conditional")
```

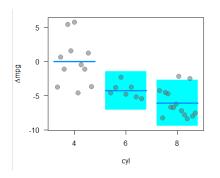

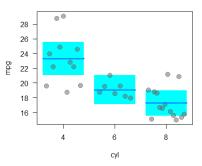

#### REGRESSION WITH FACTORS

The effects of factors can also be visualized with visreg:

# EFFECTS OF FACTORS

```
par(mfrow=c(1,2))
visreg(m4, "cyl", type = "contrast")
visreg(m4, "cyl", type = "conditional")
```

### THE PACKAGE VISREG - INTERACTIONS

```
m5 <- lm(mpg ~ cyl*wt, data = mtcars)

# summary(m5)

## Estimate Std. Error t value Pr(>|t|)

## (Intercept) 39.571196 3.193940 12.3894599 2.058359e-12

## cyl6 -11.162351 9.355346 -1.1931522 2.435843e-01

## cyl8 -15.703167 4.839464 -3.2448150 3.223216e-03

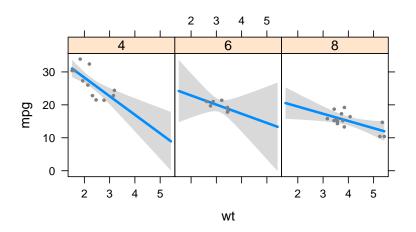

## wt -5.647025 1.359498 -4.1537586 3.127578e-04

## cyl6:wt 2.866919 3.117330 0.9196716 3.661987e-01

## cyl8:wt 3.454587 1.627261 2.1229458 4.344037e-02
```

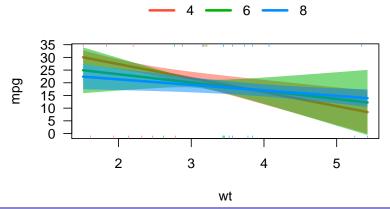

# CONTROL OF THE GRAPHIC OUTPUT WITH LAYOUT.

visreg(m5, "wt", by = "cyl",layout=c(3,1))

# THE PACKAGE VISREG - INTERACTIONS OVERLAY

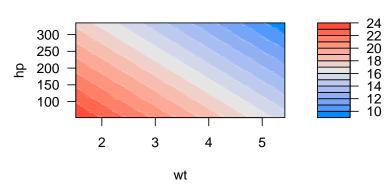

```
m6 <- lm(mpg ~ hp + wt * cyl, data = mtcars)
visreg(m6, "wt", by="cyl", overlay=TRUE, partial=FALSE)</pre>
```

### THE PACKAGE VISREG - VISREG2D

visreg2d(m6, "wt", "hp", plot.type = "image")

# mpg

## NICE TABLE OUTPUT WITH STARGAZER

library(stargazer)
stargazer(m3, type="html")

# EXAMPLE HTML OUTPUT:

	Dependent variable:
_	mpg
wt	-3.125***
	(0.911)
cyl	-1.510***
	(0.422)
am	0.176
	(1.304)
Constant	39.418***
	(2.641)
Observations	32
$\mathbb{R}^2$	0.830
Adjusted R <sup>2</sup>	0.812
Residual Std. Error	2.612 (df = 28)
F Statistic	$45.678^{***}$ (df = 3; 28)

### EXERCISE

- Install the package AmesHousing and create a processed version of the Ames housing data with the variables Sale\_Price, Gr Liv Area and TotRms AbvGrd
- ► Create a regression model with Sale\_Price as dependent and Gr\_Liv\_Area and TotRms\_AbvGrd as independent variables. Then create seperated models for the two independent variables. Compare the results. What do you think?

## THE AMES IOWA HOUSING DATA

ames\_data <- AmesHousing::make\_ames()</pre>

#### Some Variables

- Gr\_Liv\_Area: Above grade (ground) living area square feet
- TotRms\_AbvGrd: Total rooms above grade (does not include bathrooms
- ► MS\_SubClass: Identifies the type of dwelling involved in the sale.
- ▶ MS\_Zoning: Identifies the general zoning classification of the sale.
- ▶ Lot\_Frontage: Linear feet of street connected to property
- ▶ Lot\_Area: Lot size in square feet
- Street: Type of road access to property
- Alley: Type of alley access to property
- ► Lot\_Shape: General shape of property
- Land\_Contour: Flatness of the propert

### Multicollinearity

- ▶ As p increases we are more likely to capture multiple features that have some multicollinearity.
- When multicollinearity exists, we often see high variability in our coefficient terms.
- ► E.g. we have a correlation of 0.801 between Gr\_Liv\_Area and TotRms\_AbvGrd
- Both variables are strongly correlated to the response variable (Sale\_Price).

```
ames_data <- AmesHousing::make_ames()
cor(ames_data[,c("Sale_Price","Gr_Liv_Area","TotRms_AbvGrd")])
## Sale_Price Gr_Liv_Area TotRms_AbvGrd
## Sale_Price 1.0000000 0.7067799 0.4954744
## Gr_Liv_Area 0.7067799 1.0000000 0.8077721</pre>
```

## TotRms\_AbvGrd 0.4954744 0.8077721 1.0000000

#### Multicollinearity

```
lm(Sale_Price ~ Gr_Liv_Area + TotRms_AbvGrd, data = ames_data)

##

## Call:

## lm(formula = Sale_Price ~ Gr_Liv_Area + TotRms_AbvGrd, data =

##

## Coefficients:

## (Intercept) Gr_Liv_Area TotRms_AbvGrd

## 42767.6 139.4 -11025.9
```

▶ When we fit a model with both these variables we get a positive coefficient for Gr\_Liv\_Area but a negative coefficient for TotRms\_AbvGrd, suggesting one has a positive impact to Sale\_Price and the other a negative impact.

# SEPERATED MODELS

- ▶ If we refit the model with each variable independently, they both show a positive impact.
- ► The Gr\_Liv\_Area effect is now smaller and the TotRms\_AbvGrd is positive with a much larger magnitude.

```
lm(Sale_Price ~ Gr_Liv_Area, data = ames_data)$coefficients
## (Intercept) Gr_Liv_Area
## 13289.634 111.694
lm(Sale_Price ~ TotRms_AbvGrd, data = ames_data)$coefficients
## (Intercept) TotRms_AbvGrd
## 18665.40 25163.83
```

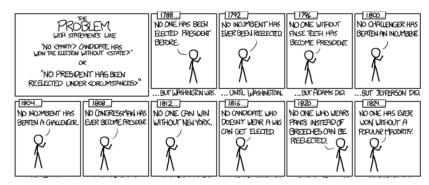

- ▶ This is a common result when collinearity exists.
- ► Coefficients for correlated features become over-inflated and can fluctuate significantly.

# Consequences

- One consequence of these large fluctuations in the coefficient terms is overfitting, which means we have high variance in the bias-variance tradeoff space.
- ▶ We can use tools such as **variance inflaction factors** (Myers, 1994) to identify and remove those strongly correlated variables, but it is not always clear which variable(s) to remove.
- Nor do we always wish to remove variables as this may be removing signal in our data.

## The Problem - Overfitting

 Our model doesn't generalize well from our training data to unseen data.

# What can be done against overvitting

- Cross Validation
- ► Train with more data
- Remove features
- ▶ Regularization e.g. ridge and lasso regression
- Ensembling e.g. bagging and boosting

# CROSS-VALIDATION

▶ Cross-validation is a powerful preventative measure against overfitting.

### Cross validation

▶ Use your initial training data to generate multiple mini train-test splits. Use these splits to tune your model.

#### NECESSARY PACKAGES

library(tidyverse)
library(caret)

# SWISS FERTILITY AND SOCIOECONOMIC INDICATORS

data("swiss")

## CROSS VALIDATION IN R

#### SPLIT DATA INTO TRAINING AND TESTING DATASET

```
training.samples <- swiss$Fertility %>%
createDataPartition(p = 0.8, list = FALSE)
train.data <- swiss[training.samples, ]
test.data <- swiss[-training.samples, ]</pre>
```

#### BUILD THE MODEL AND MAKE PREDICTIONS

```
model <- lm(Fertility ~., data = train.data)
# Make predictions and compute the R2, RMSE and MAE
(predictions <- model %>% predict(test.data))
```

```
## Moutier Veveyse Aigle Aubonne La Vallee La
